

## Helium Liquefier

Building 26 (PEMS South), room G09, contact Wayne Hutchison

The Koch Model 1410 helium liquefier is maintained and operated by the School of PEMS mechanical workshop. Helium gas boiled off during experimental measurements is piped back to the liquefier laboratory for re-liquefaction. Helium gas is stored under high pressure. The School's liquid nitrogen requirements are purchased from commercial suppliers and stored in an external tank.
